# **CMSC335**

## Web Application Development with JavaScript

## **Modules**

Department of Computer Science University of MD, College Park

Slides material developed by Ilchul Yoon, Nelson Padua-Perez

### <script> defer attribute

- **defer** attribute
- For external scripts
- Does not block the page loading
  - Tells the browser to continue with the page, and loads the script "in background", then run the script when it loads
- <script defer src="...."></script>

#### Modules

- Split features into multiple files (modules)
- A module usually contains a class or a library of functions
- A module is just a file. One script is one module
- Two types of JS module systems
  - CommonJS: implemented by Node.js
    - » "require()"
  - ECMAScript Harmony (ES6): Used for both server/client
    - » "import"

#### CommonJS Modules

- Define functions, classes, constants in a .js file, .cjs file
- Use module.exports = { } to export entities
  - Example: module.exports = { DEFAULT, add, multiply };
- Use **require** in the file you would like to use the module
  - Example: const utils = require("./utils")
    - » Assuming the file ./util.js has DEFAULT constant and two functions: add and multiply
- Example: CommonJSModules
  - driver1.js, driver2.js, driver3.js

#### **ES** Modules

- Define functions, classes, and constants in a .js, .mjs file
- Use **exports** = { } to export entities
  - Example: exports = { DEFAULT, add, multiply };
- Use **import** in the file you would like to use the module
  - Example: import \* as utils from "./utils.mjs";
    - » Assuming the file util.mjs has DEFAULT constant and two functions: add and multiply
- **Example:** ES6Modules
  - NodeExamples folder (to run these examples, package.json must have the entry "type": "module"). Try removing it
    - » driver1ES6.js, driver2ES6.js, driver3ES6.js
  - BrowserExample folder
    - » You need to run this example using a web server
      - Place files in htdocs or use VS Code Live Server
      - Try opening the file without a server; check the console

## Extensions (.js, .mjs, .cjs)

- .mjs extension for E6 modules for use with a Node.js application
  - mjs files are written in JavaScript and may use the .js extension outside of the Node.js context
- How Node.js will treat files:
  - .cjs files as CommonJS modules
  - .mjs files are E6 modules
  - .js files based on the default module system. CommonJS is the default for Node.js unless package.json has the following directive:
    - » "type": "module"
    - » Try running examples after removing from package.json "type": "module"
      - If you rename the file with a .mjs extension it will work (without "type": "module")

#### Modules in Browsers

• If a file is used in a browser, you must tell the browser that a script should be treated as module, by using the attribute

- Module scripts are always deferred
  - same effect as defer attribute
